

How to install Access to Power

Welcome! This guide walks you through getting **Access to Power** up and running. You'll do this **once**, then you can migrate as many Access databases as you want.

There are **two things** to install:

1.  **The Power Platform solution** — creates the migration tables and installs the Code App.
2.  **The helper** — a tiny program that lives on **your own Windows PC**. It reads the Access file off your hard drive (because a web browser can't).

 **Total time:** about 15 minutes.  **What you need:** a Power Apps license, a Dataverse environment, and a Windows PC.

Before you start — the checklist

Tick these off first. If anything's missing, grab it before going further.

- ☐ A **Power Apps Premium** license (the app uses Code Apps, which is a premium feature).
- ☐ A **Dataverse environment** you can create tables in. If you're not sure, ask your Power Platform admin: *"Can you give me a Dataverse environment where I'm a System Customizer or System Administrator?"*
- ☐ **Power Apps Code Apps enabled** for that environment. Ask your Power Platform admin to turn on the Admin Center feature setting **Power Apps Code Apps / Enable code apps**: "Allow users to bring apps they've created outside Power Apps and run them in Power Apps." If this setting is off, the solution can import but the Code App will not run.
- ☐ A **Windows PC** (Windows 10 or Windows 11). The helper does not run on Mac or Linux.
- ☐ The **64-bit Microsoft Access Database Engine**. This is a free download from Microsoft. Without it the helper can't read `.accdb` files.  Search the web for "**Microsoft Access Database Engine 2016 Redistributable**" and grab the `AccessDatabaseEngine_X64.exe` version.
- ☐ The **Access to Power solution file** (`AccessToPower_x_x_x_managed.zip`) — your admin or whoever sent you here should have given you this file.
- ☐ The **helper installer zip** (`AccessToPowerHelper-0.1.2-win-x64.zip`). Download the latest one from the project's GitHub Releases page:  <https://github.com/kellycason/Access-To-Power/releases/latest>

 **What's a Dataverse environment?** Think of it like a database in the cloud where Power Apps stores its stuff. Your company probably already has one (or several). You need permission to add new tables to it.

Part 1 — Import the Power Platform solution

This creates the **Access to Power** Dataverse tables and installs the **Access to Power** Code App in your Power Platform environment.

Step 1 — Open the Power Apps maker portal

1. Open your web browser.
2. Go to the right maker portal for your tenant:
 - Commercial: <https://make.powerapps.com/>
 - GCC: <https://make.gov.powerapps.us/>
3. Sign in with your work account.

Step 2 — Pick your environment

1. Use the **environment selector in the top-right** of the maker portal.
2. Pick the environment where you want to install Access to Power. (If you only see one, that's the one.)

Step 3 — Import the solution

1. In the left-hand menu, click **Solutions**.
2. At the top of the Solutions page, click **Import solution**.
3. Click **Browse** and pick the file: `AccessToPower_x_x_x_managed.zip` (the one you got from your admin).
4. Click **Next**.
5. Click **Next** again on any "connections" page — there are none to set up here.
6. Click **Import**.
7. Wait. ⌚ This usually takes **2–5 minutes**. Don't close the tab. When it's done you'll see a green check.

✅ **You'll know it worked when** you see "Access to Power" in your solutions list with a green "Managed" tag.

Step 4 — Open the app

1. Stay in the Power Apps maker portal.
2. In the left-hand menu, click **Apps**.
3. Find **Access to Power**.
4. Click **Play**.

🎉 **The cloud app is installed!** Keep it open, then install the helper on the workstation that has the Access database.

Part 2 — Install the helper (the PC part)

The helper is a small Windows program. It does **one** thing: when the app asks it to, it opens your Access file and uploads what's inside.

🔒 **Is this safe?** Yes. The helper runs as **you**, only when **you** open the app, and only reads files **you** point it at. It doesn't run in the background. It doesn't phone home. It signs into the same Microsoft account you already use.

Step 1 — Install the Access Database Engine (one time)

💡 **Skip this step** if you already have Microsoft Access installed on this PC, or if your IT department has already pushed the database engine to your machine.

1. Download `AccessDatabaseEngine_X64.exe` from Microsoft's website.
2. Double-click it.
3. Click **Next**, accept the license, click **Install**.
4. When it says "Setup Completed Successfully," click **OK**.

Step 2 — Unzip the helper

1. Download `AccessToPowerHelper-0.1.2-win-x64.zip` from <https://github.com/kellycason/Access-To-Power/releases/latest> (or use the copy your admin sent you).
2. **Right-click** the zip file.
3. Choose **Extract All...** in the menu that pops up.
4. Click **Extract**. Windows makes a new folder next to the zip with the same name.
5. Open that new folder. You should see files like:
 - `AccessToPowerHelper.exe`
 - `install-helper.ps1`
 - `uninstall-helper.ps1`
 - `README.md`

Step 3 — Run the installer

This is the only part that uses a tiny bit of PowerShell. **It's just two clicks and one paste.** Follow exactly:

1. In the folder from step 2, **hold Shift** and **right-click** in some empty space inside the folder (not on a file).
2. Choose **Open in Terminal** (or **Open PowerShell window here** on older Windows). A black-or-blue window opens.
3. **Copy** the line below by clicking it once:

```
powershell.exe -ExecutionPolicy Bypass -File .\install-helper.ps1
```

4. **Paste** it into the black window. (Right-click in the window, or press **Ctrl+V**.)
5. Press **Enter**.

The installer prints a few lines like `==> Installing helper to ...` and finishes with:

```
Access-To-Power Helper installed successfully.
```

✔ **You'll know it worked when** you see the green "installed successfully" message. You can close the black window now.

⚠ **If you see a yellow warning** that says "Microsoft ACE OLEDB provider was not detected" — go back to Step 1 and install the Access Database Engine. The helper installed, but it won't be able to read `.acddb` files until that engine is on your PC.

Step 4 — That's it!

The helper is now installed in `C:\Users\<you>\AppData\Local\AccessToPower\Helper`. You'll **never need to open it manually** — the app will pop it open for you when it needs to read a file.

If you want to verify, look in **Settings > Apps > Installed apps** and search for **"Access-To-Power Helper"**. It should be in the list.

✔ Try it out

1. Open the **Access to Power** Code App.
2. Click **New Migration**.
3. When the app asks you to pick your `.acddb` file, your browser may show a popup asking "Open AccessToPowerHelper?" — click **Open** (and tick "Always allow..." if you don't want to be asked again).
4. The helper opens, prompts you to sign in with your work account, and lets you pick your `.acddb`.

🧙 **You're done!** Follow the wizard from there.

SOS Help! Something went wrong

What you see	What to do
"This page can't be displayed" when you click an <code>accesstopower://</code> link	The helper isn't installed yet, or didn't register. Re-run Part 2 > Step 3 .
"Solution import failed" in Part 1	Make sure you're a System Customizer or System Administrator on that environment. If you are, try once more — sometimes the platform is just busy.
"This app isn't opening correctly" and the page says the environment does not allow this operation for this Code app	The Power Apps Code Apps / Enable code apps feature setting is off for the environment. Ask your Power Platform admin to turn it on in the Power Platform Admin Center, then reopen the app.
I imported the solution but don't see the app	Refresh the maker portal, confirm you're in the same environment, then check Apps for Access to Power .

Yellow "ACE OLEDB provider was not detected" warning	Install the Microsoft Access Database Engine — see Part 2 ▸ Step 1 .
"Cannot run scripts on this system" when running the installer	You typed <code>install-helper.ps1</code> directly. Use the full command in Part 2 ▸ Step 3 — it starts with <code>powershell.exe -ExecutionPolicy Bypass ...</code>
The helper opens but says "Sign-in failed"	Make sure you're signing in with the same account you use for Power Apps, and that account has access to the target environment.
The app doesn't see the helper when I click "Scan"	Close the browser tab and reopen the app. Make sure you ran the installer (not just unzipped the folder).

How to uninstall

The helper: Open **Settings ▸ Apps ▸ Installed apps**, find **Access-To-Power Helper**, click the three dots, click **Uninstall**.

The app: In the Power Apps maker portal, select the environment in the top-right, open **Solutions** from the left-hand menu, find **Access to Power**, click the three dots, then click **Delete**.
